From Insight to Impact: The Cardiac Insight Partner Summit in Busan, and what we brought home.

On October 24, Cardiac Insight welcomed partners & KOLs from around the world to Partner Summit 2026 in Busan — with the event also streamed live to our global community. Thank you to everyone who joined us in the room or online and made the day so meaningful. Under the theme "From Insight to Impact: Together We Advance," the afternoon was designed as a co-created experience, bringing together updates from Cardiac Insight Openings, talks by leading KOLs in electrophysiology and neurology, a clinical case study, and a partner presentation from our distributor in Kuwait.

Your energy and openness — in Busan and beyond — turned a gathering into a conversation, and we look forward to building on this momentum together.

Cardiac Insight Partner Summit 2026 Special Session 1 | Cardiac Insight Opening Session

This year, Roy Kim, CGO opened the Summit with a warm welcome to partners and KOLs gathered in Busan. Ricky Pae, MKT Director, then shared what we have built together: 1M+ patients over 17+ years across 20+ countries, followed by how Cardea 20/20 supports sudden cardiac arrest prevention with a false-positive rate of about 2%, and what comes next.

Special Session 2 | Beyond the Snapshot From Intermittent Symptoms to AF Burden and Arrhythmia Diagnosis

Dr. Ng Kim Fong, KPJ Kluang Specialist Hospital, Malaysia

Dr. Ng Kim Fong showed why a short ECG can leave the question open, since intermittent arrhythmias often occur between visits. He walked through how monitoring should match symptom frequency, and how a 7-day report can turn real cases, from PVC burden to pauses and AF, into clear clinical decisions.

Special Session 3 | From Detection to Insight What Can Continuous Monitoring Tell Us?

Our Clinical Affairs team showed how continuous monitoring moves from detecting arrhythmia to understanding it. A case from Indonesia followed a patient with syncope from a 7-day Cardea SOLO report to ICD implantation, and a repeat study six months later guided same-day decisions. The session closed with a research invitation: can early AF burden after PFA predict late recurrence?
